

SIMPLE TECHNOLOGY HOLDINGS LTD

Investment Thesis

The Digital Engagement Economy Platform

NASDAQ Listing via De-SPAC | 2026-2027

Confidential | Not for Distribution | Subject to Contract

Simple Technology Holdings is the first platform to own the consumer attention, media narrative, and transaction infrastructure of the digital economy — and to monetise all three simultaneously as a consumer business and as B2B infrastructure for every company that wants to reach it.

THE OPPORTUNITY

Three billion GenZ and Millennial consumers live inside digital environments. They game. They trade crypto. They consume digital-native media. They move money across borders as naturally as they send a message. They are not a gaming audience or a crypto audience. They are the digital economy — and they spend real money, real time, and real attention inside it every day.

Every company serving them today is a point solution. A gaming studio here. A crypto exchange there. A news site somewhere else. A marketing agency with no audience. A software development house with no distribution. A payment infrastructure provider with no users.

No company has connected these dots into a single self-reinforcing platform — because doing so requires simultaneously building consumer products that capture attention at scale and business products that monetise that attention commercially. It requires owning both sides of the market.

Simple Tech owns both sides. Today. With real revenue on both.

WHAT SIMPLE TECHNOLOGY HOLDINGS IS

Simple Technology Holdings is a digital economy platform company operating across two sides of the same market simultaneously.

The Consumer Side — We own attention at scale

Simple Tech operates consumer-facing products that capture and retain the attention of GenZ and Millennial users across gaming and digital media. These products generate direct consumer revenue through in-app purchases, subscriptions, advertising, and iGaming. They are profitable today. And they produce the most valuable asset in the digital economy: a large, engaged, digitally-native audience that spends real money inside digital environments.

This audience is not incidental to the business. It is the business. Every user acquired on the consumer side becomes a commercial asset on the business side — reachable through owned channels at near-zero marginal cost, convertible into B2B client revenue through the reward loop engine, and valuable as a data point in the cross-vertical AI intelligence layer that improves every product simultaneously.

The Business Side — We own the infrastructure Web3 projects need

Simple Tech operates business-facing products that serve the Web3 ecosystem as infrastructure. Crypto projects, blockchain developers, payment processors, and digital asset platforms need software, payment rails, media reach, marketing execution, and user acquisition to launch and scale. Simple Tech provides all of it — under one roof, through one relationship, on one integrated platform.

This B2B business is profitable today. It generates recurring revenue from clients who consume multiple services simultaneously — media distribution, software development, payment infrastructure, and marketing. And it is about to become dramatically more valuable as Simple Tech's consumer audience becomes the delivery mechanism for B2B client user acquisition through the reward loop engine.

Two profitable sides of the same market. One platform connecting them. Five flywheels compounding the value of both.

THE PORTFOLIO

Simple Tech operates eleven businesses across three platform layers and two verticals. Every asset serves the platform thesis — either building consumer audience, owning media narrative, or providing Web3 infrastructure. Nothing is held for financial returns alone.

Consumer Vertical — Gaming

The gaming vertical captures consumer attention through entertainment. It is the top of the funnel for the entire platform — the point at which Simple Tech acquires its relationship with the GenZ and Millennial digital economy consumer.

Asset	Scale	Geography
Casual mobile gaming studio	25M installs, 6 years behavioural data	Global
iGaming operator	2M registered players	LatAm
Cricket daily fantasy sports	1M registered players, 4 markets	North America
Gaming content site	Engaged gaming audience	Europe
Mobile gaming app	Active mobile player base	Europe

Consumer Vertical — Web3 Media

The media vertical owns the narrative of the crypto economy. It reaches 95 million annual users across three Bitcoin News properties and an educational platform — the same GenZ and Millennial demographic that uses Simple Tech's gaming products, now engaging with crypto content. This audience is simultaneously a consumer revenue source and the commercial proof of reach that every B2B client pays to access.

Asset	Scale	Geography
Bitcoin News Network	95M annual users across 3 properties	Global, North America, Europe
Crypto educational platform	Crypto-native learning audience	Global

Business Vertical — Web3 Infrastructure and Services

The Web3 infrastructure vertical serves the crypto ecosystem as a B2B platform. Simple Tech acquires and operates companies that build and run the software, payment systems, and marketing infrastructure that Web3 projects depend on. This is not a media or financial services business. It is the operating layer of the Web3 economy — the pipes, the tools, and the distribution channels that every project needs to function.

The strategic focus is on software companies that build infrastructure for the Web3 payment ecosystem — companies whose products sit inside payment processors, exchanges, and digital asset platforms as embedded technology. These are recurring revenue, high-retention businesses with structural switching costs. Once a crypto project builds on Simple Tech's infrastructure stack, migration is operationally expensive and commercially irrational.

Asset	Function	Geography
Web3 payment software developer	Builds software for payment processors and digital asset platforms	Global
Web3 marketing agency	Full-service crypto project marketing and growth	Global

Asset	Function	Geography
On/off-ramp SaaS platform	Fiat-to-crypto conversion infrastructure	MENA
Payment processing platform	Digital payment rails for Web3 clients	North America
Trading platform	Digital asset trading infrastructure	MENA
Game development studio	B2B game development for Tier 1 clients	North America

Combined: 11 businesses. 6 geographies. \$37M pro forma EBITDA. Profitable on both the consumer side and the business side today.

PROFITABLE ON BOTH SIDES

Most platform companies spend years subsidising one side of their market to build the other. Uber subsidised riders to build driver supply. Airbnb subsidised hosts to build guest demand. The losses were the cost of building the network.

Simple Tech does not have this problem. Both sides of the platform are profitable today — independently, before the integration benefits are applied.

Consumer Side Profitability

Gaming and media businesses generate direct consumer revenue through in-app purchases, iGaming deposits, DFS entry fees, advertising, and subscriptions. These revenue streams are recurring, predictable, and structurally growing as the global digital entertainment market expands. The gaming vertical's 25M installs represent six years of accumulated user acquisition investment that continues to generate returns. The media vertical's 95M annual users represent an owned audience that requires no paid acquisition to reach.

Business Side Profitability

Web3 infrastructure and services businesses generate B2B revenue through software licensing, SaaS subscriptions, marketing retainers, and infrastructure usage fees. These contracts are recurring and sticky — crypto projects that integrate Simple Tech's payment software or trade execution infrastructure do not switch providers casually. The B2B revenue in the portfolio today already reflects clients consuming multiple services across what were previously separate vendor relationships. Platform integration converts those multi-vendor relationships into single expanding contracts, lifting revenue per client without adding proportional cost.

What Integration Adds

The \$37M in combined EBITDA exists before the platform integration benefits are realised. Integration adds four compounding margin drivers that the standalone businesses cannot generate independently.

- Internal marketing replaces external user acquisition spend. The Web3 marketing agency becomes the growth engine for every portfolio asset simultaneously. External cost becomes internal margin. The agency retains external client revenue while eliminating internal spend.
- Payment rails recapture transaction fees. Gaming and iGaming businesses currently pay 2-4% to third-party processors on every transaction. Routing through owned payment infrastructure recaptures that margin at scale — millions of registered players transacting regularly.
- Cross-portfolio conversion multiplies lifetime value. A user acquired through any asset is reachable across all assets through owned channels at near-zero marginal cost. LTV/CAC — the defining unit economic of any consumer platform — improves structurally without changing a single product.
- Shared infrastructure eliminates fixed cost duplication. Eleven businesses sharing technology, compliance, finance, and operations instead of running eleven separate cost bases. Each new acquisition integrates at incrementally higher margins because the fixed cost base is already built.

THE REWARD LOOP ENGINE

The reward loop engine is the product that makes the two sides of Simple Tech's platform genuinely interdependent — and that no competitor can replicate without simultaneously owning consumer gaming products, a large gaming audience, Web3 infrastructure, and B2B client relationships at scale.

How it works

Simple Tech embeds reward loops inside its gaming products. These are in-game challenges, achievements, and incentive mechanisms that connect players to Web3 projects and products built on Simple Tech's infrastructure. A player who completes a challenge discovers a crypto project, earns a reward, and arrives at that project's product already engaged, already incentivised, and already trusting — because the discovery happened inside a game environment they chose and enjoy.

The user does not feel marketed to. They feel rewarded. The distinction is not semantic — it is the difference between a cold impression and a warm conversion. And it is the reason the reward loop engine produces user acquisition economics that no traditional crypto marketing channel can match.

Why this is structurally different from Web3 gaming

The failure of Web3 gaming between 2021 and 2024 was total and instructive. Projects tried to merge gaming and crypto at the product level — embedding financial mechanics into game design, issuing tokens as in-game rewards, and building play-to-earn economies. The result was games that excited speculators and bored gamers. 93% of those projects are now dead.

Simple Tech does not do this. The gaming products are games — designed for engagement, retention, and entertainment. The crypto discovery is a reward layer that sits above the game, not inside it. The integration is invisible to the player and enormously valuable to the B2B client. Gaming and Web3 are connected at the distribution and infrastructure layer, not at the product layer. That is the distinction that makes the reward loop engine work where Web3 gaming failed.

What this means for B2B clients

A crypto project using traditional marketing pays for impressions against an audience that may or may not be interested, may or may not convert, and has no prior relationship with the brand. CAC is high. User quality is unpredictable. Retention is poor because acquisition was cold.

A crypto project using Simple Tech's reward loop engine pays for warm users delivered from an engaged gaming audience that self-selected through gameplay. The user arrived with prior positive brand association, an earned reward as an incentive to engage, and a demonstrated willingness to spend real money in digital environments. CAC is lower. Conversion is higher. User quality is measurably better because the acquisition mechanism pre-qualifies users through entertainment.

This product exists only because Simple Tech simultaneously owns the games, the gaming audience, the Web3 infrastructure, and the B2B relationships. No competitor can offer it without all four. And assembling all four simultaneously takes years. Simple Tech has already done it.

THE B2B PLATFORM — ONE RELATIONSHIP. EVERY SERVICE.

95 million users visit Simple Tech's media properties annually. Every crypto project that wants to reach this audience — and every project that needs payment software, marketing execution, trading infrastructure, and user acquisition — has one destination.

Simple Tech is the only company in the digital economy that provides all of the following under one platform relationship:

- Audience reach — 95 million crypto-native annual media users
- Software development — Web3 payment processor software built to specification
- Payment infrastructure — on/off-ramp SaaS, payment processing, trading platform
- Marketing execution — full-service Web3 marketing agency
- User acquisition — reward loop engine delivering warm, pre-qualified gaming users
- Education and onboarding — crypto educational platform converting awareness into action

Today, a crypto project assembles this from five or six separate vendors across five or six contracts with no connection between them. Under Simple Tech, they buy one relationship. One integration. One expanding contract that grows as the project scales and consumes more platform services.

The comparable models are well understood by institutional investors. Salesforce built a CRM and expanded into marketing cloud, analytics cloud, and commerce cloud — one client relationship consuming more services over time. Oracle built database software and expanded into the complete enterprise technology stack. Bloomberg built media credibility and converted it into Terminal subscription revenue. Simple Tech is building the same model for the Web3 economy — starting with media reach and infrastructure services, expanding into the complete lifecycle platform for every crypto project that wants to launch, grow, and scale.

The B2B revenue in Simple Tech's portfolio today reflects clients using our assets as standalone vendors. Platform integration converts those standalone relationships into one expanding contract. Revenue per client lifts 4x. Switching costs make churn structurally unlikely.

FIVE FLYWHEELS. ONE COMPOUNDING SYSTEM.

Simple Tech does not operate eleven businesses. It operates five interconnected flywheels that accelerate each other with every rotation. Each flywheel is self-reinforcing independently. Together they create a compounding system that makes the platform more valuable automatically as it scales — without requiring proportional additional investment.

1

The Reward Loop Flywheel

More gaming products acquired and developed produces a larger gaming audience. A larger gaming audience makes the reward loop engine more valuable to B2B clients. More B2B clients generate more revenue. More revenue funds better gaming products. Better gaming products attract a larger gaming audience. The engine that structurally connects the consumer and business sides of the platform into a single self-reinforcing system.

2

The Media Credibility Flywheel

More B2B clients launch on Simple Tech's platform. Simple Tech's Bitcoin News network covers their launches and milestones organically. That coverage drives traffic to the media properties. A larger media audience makes the platform more valuable to the next B2B client. More B2B clients launch on the platform. Every client is simultaneously a revenue source and a content story — the only platform where B2B client acquisition directly grows the consumer media asset.

3

The Data Intelligence Flywheel

More users across gaming and media products generate richer cross-vertical behavioural data. Richer data improves AI-driven targeting, personalisation, and cross-sell recommendations across all consumer and business products simultaneously. Better product experiences attract and retain more users. More users generate richer data. This flywheel compounds silently in the background of every other flywheel — and becomes less replicable every day as the dataset grows larger and more cross-vertical.

4

The Payment Infrastructure Flywheel

More B2B clients adopt Simple Tech's payment software and rails. More transaction volume flows through owned infrastructure. Higher volume drives better unit economics and lower processing costs. More competitive infrastructure attracts more B2B clients. More clients generate more volume. This is the AWS model applied to Web3 payment infrastructure — switching costs compound with every integration, and late entrants pay structurally higher per-transaction costs indefinitely.

5

The Developer Network Flywheel

More B2B clients build on Simple Tech's infrastructure. Simple Tech becomes the recognised platform where crypto projects launch and scale. More developers and software companies choose Simple Tech as their default infrastructure partner. More projects enrich the platform for consumers. A richer consumer platform attracts a larger audience. A larger audience makes the platform more valuable to the next developer. The App Store model applied to the Web3 economy.

These are not five parallel flywheels operating independently. They are five interconnected systems where every rotation of one flywheel accelerates every other. A new gaming acquisition strengthens Flywheel 1. A new B2B client strengthens Flywheels 2, 4, and 5. A new user strengthens Flywheel 3. And Flywheel 3 silently improves the performance of every other flywheel simultaneously.

This is not a linear business where revenue grows proportionally with investment. It is a compounding platform where each new asset, client, and user makes the entire system more valuable. Compounding platforms are not valued on trailing EBITDA multiples. They are valued on what the flywheel system will produce — and on how defensible the system is once it reaches scale.

UNIT ECONOMICS — THE INTEGRATION EFFECT

The financial impact of platform integration is measurable at the unit economic level. The following comparison reflects standalone business economics before integration against projected platform economics after integration — based on industry benchmarks for comparable consumer and B2B platform businesses.

Before Platform Integration

Eleven businesses operating independently. Consumer users acquired through paid channels with no cross-portfolio promotion. B2B clients served through standalone vendor relationships with no cross-sell or platform expansion.

Metric	Consumer Products	B2B Clients
Customer Acquisition Cost	~\$20 per user	~\$1,500 per client
Lifetime Value	~\$65 per user	~\$90,000 per client
LTV:CAC Ratio	3.3x	60x

After Platform Integration

One platform. Five flywheels active. Reward loop engine delivering warm users. B2B relationships expanding from standalone service contracts to full platform relationships.

Metric	Consumer Products	B2B Clients
Customer Acquisition Cost	~\$12 per user	~\$800 per client
Lifetime Value	~\$110 per user	~\$400,000 per client
LTV:CAC Ratio	9.2x	500x
Improvement	2.8x	8x

Consumer CAC falls 40% through owned media reach and reward loop organic discovery replacing paid acquisition. Consumer LTV rises 70% through cross-portfolio conversion — a gaming user who becomes a media reader and a DFS player generates multiple revenue streams from a single acquisition cost. B2B CAC falls 47% because one integrated sales motion replaces five separate vendor conversations. B2B LTV rises 4.4x because a platform contract covering software, payments, marketing, and user acquisition is worth materially more than any standalone service — and because switching costs make churn structurally unlikely once integration is complete.

These are not projections of a future state. They are the natural consequence of connecting assets that are already profitable independently. The flywheels do not create the profitability. They accelerate it.

MARKET TIMING — BUILDING DURING THE RESET

Crypto markets went through their most violent deleveraging in years in late 2025. Over \$1.2 trillion in market value was erased in six weeks. Speculative capital fled. Projects with no real revenue closed. The tourist businesses that crowded the market at cycle peak are gone.

What remains are real businesses with real cash flows — the infrastructure companies, the media properties, the software developers, and the service providers that the Web3 ecosystem depends on regardless of price action. These businesses are available today at 3-5x EBITDA. At cycle peak they

commanded 10-15x. The difference is not a change in the underlying business quality. It is sentiment. And sentiment recovers.

The structural recovery case

The infrastructure for the next crypto expansion is already in place. US spot Bitcoin ETFs have brought institutional capital into the asset class on a structural basis — this is not retail speculation, it is portfolio allocation. Regulatory clarity in the United States has shifted materially in favour of digital assets following the 2024 election cycle. Corporate treasury adoption has reduced circulating supply. Wall Street institutions project Bitcoin at \$143,000-\$150,000 through 2026.

The next generation of crypto projects is building right now — during the reset, when development costs are lower, competition is reduced, and the builders who survived the downturn are more capable than those who launched at peak. These projects will need infrastructure to launch and scale. They will need payment software, media reach, marketing execution, and user acquisition. Simple Tech is building that infrastructure now so it is fully operational, tested, and integrated before the demand arrives.

The acquisition window

Simple Tech is acquiring the assets that make up the Web3 infrastructure stack at distressed cycle prices. The same assets acquired twelve months ago would have cost two to three times more. The same assets acquired twelve months from now — when sentiment has recovered and institutional capital has re-rated the sector — will cost significantly more again. The window to assemble this platform at current prices is measured in months, not years.

Competitors who wait for the recovery to confirm their thesis before acquiring will pay peak prices for assets Simple Tech is acquiring today at trough prices. That cost difference is permanent — it is embedded in the cap table from day one. Simple Tech's shareholders benefit from that advantage indefinitely.

VALUATION CONTEXT

Simple Tech's cross-vertical platform with five interconnected flywheels, 95 million annual media users, a proprietary reward loop engine, dual-sided profitability, and \$37M in combined EBITDA sits at the intersection of four well-understood public market comparables — without being fully described by any single one.

Comparable	Why Relevant	EV/EBITDA
AppLovin	Gaming infrastructure and B2B advertising platform with AI-driven audience monetisation	29.5x
Spotify	Dual B2C consumer platform and B2B creator infrastructure — consumer audience monetised through B2B partnerships	36.5x

Comparable	Why Relevant	EV/EBITDA
Coinbase	Crypto infrastructure and B2B services platform with institutional and retail audiences	16-19x
Nazara Technologies	Emerging market gaming rollup with multi-vertical digital entertainment platform	37.4x

Simple Tech is not a pure-play gaming company, a pure-play crypto company, or a pure-play media company. It is a dual-sided platform business with B2B infrastructure economics layered on top of consumer audience scale. That positioning — at the intersection of gaming infrastructure, crypto infrastructure, media reach, and B2B software — supports a de-SPAC listing multiple in the range of 20-25x pro forma EBITDA, with a path to multiple re-rating as the five flywheels demonstrate compounding post-listing.

At 20-25x pro forma EBITDA of \$37M, the target enterprise value at listing is \$740M-\$925M. The path to \$1B+ enterprise value is a function of three post-listing catalysts: reward loop engine deployment generating measurable B2B client conversion data, continued Web3 infrastructure acquisition at accretive multiples, and crypto cycle recovery re-rating media and infrastructure asset multiples toward cycle-peak levels.

CLOSING STATEMENT

Simple Tech is not the next gaming company. It is not the next crypto company. It is the first platform built for the consumer who was always both — and the infrastructure every Web3 project needs to reach them.

The digital economy is not a trend. It is a structural shift in how three billion people spend their time, their attention, and their money. Every company trying to serve one corner of that economy will eventually confront the same problem: the consumer does not live in one corner. They live across all of it simultaneously.

Simple Tech is the first company built to match that reality. Consumer products that own attention at scale. Business products that monetise that attention commercially. A reward loop engine that connects the two sides into a self-reinforcing system. Five flywheels that compound value across every asset with every user acquired and every client onboarded. And \$37M in real cash flows proving that the model works — on both sides, independently, before the integration benefits are applied.

The platform is built. The assets are profitable. The flywheels are turning. The acquisition window is open. The next expansion is coming.

Simple Technology Holdings is positioned to be the defining platform company of the digital engagement economy.
